City Launches New Public Transport Program to Reduce Traffic

Mumbai, September 4, 2026

The city administration has announced a new public transport program aimed at reducing traffic congestion and improving daily travel for residents. The program will introduce additional electric buses on busy routes and increase the frequency of services during morning and evening peak hours.

Officials said the first phase will focus on areas where commuters regularly experience long waiting times. The new buses are expected to provide a quieter and more environmentally friendly alternative to conventional diesel vehicles. The administration also plans to install additional charging stations at selected bus depots.

According to the transport department, the project is being introduced after a review of passenger travel patterns. The review found that overcrowding and irregular service were two of the main concerns reported by commuters. Authorities believe that more frequent services could encourage people to use public transport instead of private vehicles.

The project will initially operate on ten major routes. Officials will monitor passenger numbers, travel times, and operating costs during the first six months. If the program meets its targets, the number of electric buses may be increased and the service could be expanded to additional parts of the city.

Transport experts welcomed the announcement but said that long-term improvements would require better coordination between buses, trains, and other forms of public transport. They also recommended improving pedestrian facilities around major transport stations so that commuters can travel more easily between different services.

The administration said that public feedback will be collected throughout the first phase. Residents will be able to report service problems and suggest improvements through the city's public transport website and customer support channels. The authorities expect the first group of new buses to begin operating within the next few weeks.
